

## Quazi-M070

Ryan Neal, Scott Ross, Matt Preciado

Quazi-M070 (*quazi-moto*) is a motorcycle accessory that enables riders to easily switch between listening to an iPod and having a conversation on their cell phone; all without wires.

For the longest time motorcycle riders have had two choices when it came to answering the phone and riding: either be tied down by a bundle of wires, or resign themselves to missing any calls while on their motorcycle. Utilizing Bluetooth Quazi-M070 (*quazi-moto*) provides a third solution that is light weight, simple and safe. The Quazi-M070 system allows the rider to easily interface a cell phone and their iPod with the base station that will in turn provide a clear and convenient link to a module imbedded in the helmet; all without the burden of cords.

While using the Quazi-M070 system a rider can be cruising along listening to their iPod inside their helmet, be notified of an incoming phone call, and with the press of one button be connected to the call. Once they are done the rider simply presses the same button and the music is automatically restarted for them. By allowing a rider to simply switch between listening to their music and talking on their phone Quazi-M070 safely provides an extra level of enrichment to motorcycle riding.
